

C900 CentraPlex Controller

Veeder Root Integration

Veeder Root is the leading brand of level gauging and leak detection monitor for underground and aboveground fuel tanks. Its dominate market share is said to be over 75% which qualifies its reputation as the industry standard. Earthsafe controllers are designed to integrate with the data networking capability of the Veeder Root Tank Monitor TLS-300 or TLS-350.

The Veeder Root data output is an ASCII protocol, available as either RS-232, RS-485 or Ethernet. The Earthsafe C900 CentraPlex or C700 Intraplex Controllers communicate with the Veeder Root panel to extract vital tank information. This typically includes Tank Volumes, Tank Alarms, and Leak Detection Alarms.

The benefit of the Earthsafe Controller's integration of the Veeder Root data is as follows:

- (a) The tank volume and alarm status can be delivered to the BMS system with a common interface of all other fuel system operating information.
- (b) The tank volume and alarm system can be displayed for operating personnel at multiple locations within the building such as fill stations, basement tank rooms, rooftop generator sets, and boiler rooms.
